

Probiotic without effect against *Salmonella*

April 19 2010

Many tourists travelling abroad go down with diarrhoea, which can be caused by *Salmonella*. While probiotics are often cited as the solution to various stomach problems, the probiotic, *Lactobacillus plantarum* has no effect on *Salmonella*, reveals a new thesis at the University of Gothenburg, Sweden.

In Sweden around 4,000 people a year are infected with *Salmonella* bacteria, with around 85 per cent picking up the infection abroad. The [acute infection](#) is generally followed by a lengthy period of stomach troubles such as diarrhoea, stomach ache, wind and constipation.

"Antibiotics are used in serious cases of *Salmonella*, but there isn't a good treatment for the acute diarrhoea and the more protracted symptoms," says Elisabet Lönnemark, doctor in the Department of Infectious Disease at Sahlgrenska University Hospital and researcher at the Sahlgrenska Academy.

[Probiotics](#) are currently being trialled as a treatment for a number of different conditions, but few studies have investigated whether they have any effect on patients with *Salmonella*.

"We wanted to see whether probiotics, in this case a lactic acid bacterium, could be used to treat diarrhoea in patients with *Salmonella*," says Lönnemark.

The study included 163 *Salmonella* patients, 90 per cent of whom had picked up the infection abroad. Half were treated with the probiotic

lactic acid bacterium, while the other half were given powdered skimmed milk. The outcome was that the group on the probiotic did not have less diarrhoea or a shorter period with the *Salmonella* bacteria in their gut.

"We could see that the men who were treated with the probiotic bacterium were less constipated than those who were given the powdered skimmed milk," says Lönnermark. "Whatever the treatment, the women felt ill to a greater extent and also had diarrhoea for longer than the men, though they got rid of the *Salmonella* bacteria slightly more quickly."

There is a rising public interest in the role of [gut bacteria](#) in our health and how we can affect these bacteria by taking probiotics.

"The bacteria we have in our gut seem to be important for our health, and probiotic bacteria could ease and prevent various symptoms, but it's a matter of finding the right bacterium for the condition you're treating, and perhaps combining several different bacteria," says Lönnermark. "What's more, the effects can differ between women and men."

Probiotics are living microorganisms, for example different lactic acid bacteria and yeasts, that have a positive impact on our health. The most common forms are lactobacilli and bifido bacteria. Studies have shown that probiotics can sometimes reduce diarrhoea caused by viruses or [antibiotics](#), and can also alleviate inflammatory intestinal diseases and ease constipation. Probiotics can be taken as tablets or as yoghurt and fruit drinks with the organisms added.
