

US agency approves 'five-day-after' contraceptive pill

August 14 2010

A US regulatory agency on Friday approved an emergency contraceptive pill that can prevent pregnancy if taken up to five days after unprotected sex.

The Food and [Drug](#) Administration said it granted approval for the drug, called ella, after two phase III clinical trials that "provided compelling data on efficacy and sufficient information on safety."

The drug, manufactured by French firm HRA Pharma, successfully "prevents pregnancy when taken orally within 120 hours (five days) after a [contraceptive](#) failure or unprotected intercourse," the FDA said in a statement.

"It is not intended for routine use as a contraceptive," the agency added.

The drug works by inhibiting or delaying ovulation, and has side effects similar to other emergency contraceptives already on the market, such as Plan B, which prevents [pregnancy](#) if taken within 72 hours after intercourse.

The drug's approval followed a positive recommendation by an FDA advisory committee on June 17.

The drug has been available in Europe since May 2009, under the name ellaOne, and will be distributed into the United States by New Jersey-based Watson Pharma Inc.
