

Mexico state near US on alert after H1N1 deaths

March 28 2011

Authorities in Mexico's Chihuahua state along the US border announced preventive health measures Sunday to stanch a return of an H1N1 epidemic after four people recently died of the virus.

"School checks will be implemented following a renewed outbreak of H1N1 human [influenza](#), as a means of protecting all students from possible infection," said Javier Gonzalez, Chihuahua's deputy secretary of education, culture and sport.

Gonzalez said four people had died in the state since last week, when authorities discovered a fresh outbreak of the virus, and state health officials quickly launched a vaccination campaign and outreach programs to inform the population about prevention measures.

Mexico raised the first H1N1 alert in April 2009, and [swine flu](#) -- so named because it was first identified in pigs in Mexico -- has killed some 18,500 people since emerging that spring, according to the World Health Organization.

An H1N1 outbreak has also been detected in Venezuela, where health authorities last week said 85 people had recently contracted the virus, and three people with H1N1 have died this year.
