

Green light for flu vaccine in transplant recipients

April 28 2011

Getting vaccinated against the flu lowers kidney transplant recipients' risk of organ loss and death, according to a study appearing in an upcoming issue of the *Clinical Journal of the American Society Nephrology* (CJASN). The results suggest that concerns about the safety of the influenza vaccine in transplant recipients are unwarranted.

Influenza can cause severe illness and even death in some individuals. Organ transplant recipients and those taking immunosuppressant medications face a particularly high risk of dying after being infected. Protection against the flu is especially important for these patients, but earlier reports have suggested that [influenza](#) vaccination might activate an [immune response](#) that could trigger rejection of transplanted organs. Some studies have also suggested that the immunosuppressant medications that transplant recipients take may decrease the effectiveness of the influenza vaccine.

To investigate these issues, Frank Hurst, MD (Walter Reed Army Medical Center and F. Edward Hebert School of Medicine) and his colleagues assessed Medicare claims for influenza vaccination and influenza infections in 51,730 adult [Medicare patients](#) first transplanted from January 2000 to July 2006 and were followed through October 2006. There were 9,678 (18.7%) patients who were vaccinated against the flu in the first year after transplantation. These individuals were 23% less likely to experience organ loss and 18% less likely to die during the study period than individuals who were not vaccinated. A total of 310 (0.6%) patients got the flu. They were no more likely to experience

organ loss than patients who did not get the flu.

These findings do not support withholding immunization on the basis of concerns that the [influenza vaccine](#) could negatively affect transplanted organs. The authors noted, however, that no data are currently available to prove that [influenza vaccination](#) actually prevents the flu in transplant recipients.

More information: The article entitled, "Outcomes Associated with Influenza Vaccination in the First Year after Kidney Transplantation," will appear online on April 28, 2011, [doi 10.2215/CJN.05430610](https://doi.org/10.2215/CJN.05430610)
