

More women medical students select general surgery and continue to close the gender gap

April 4 2011

The gender gap among United States Medical Graduates (USMG) in the traditionally male-dominated specialty of general surgery is shrinking, according to study results published in the March issue of the *Journal of the American College of Surgeons*. These findings align with the overall trend of increasingly equal gender enrollment of medical students.

The study found a 22 percent relative increase in the percentage of women among USMG applicants to general surgery programs between application years 2000 (n = 506; 27%) and 2005 (n = 754; 33%). Additionally, there was a 25 percent relative increase in the percentage of women among USMG who began general surgery training between academic years 2000-2001 (n = 282; 32%) and 2005-2006 (n = 384; 40%).

The study authors analyzed three related populations: (1) all USMG from academic years 1999-2000 through 2004-2005; (2) USMG applicants to positions at Accreditation Council for Graduate Medical Education (ACGME)-accredited general surgery residency programs for applicant years 2000 through 2005; and (3) USMG entering positions at ACGME-accredited general surgery training programs between academic years 2000-2001 to 2005-2006.

During the six-year study period, the percentage of women entering training increased not only in general surgery, but also in the surgical specialties of obstetrics and gynecology, ophthalmology, orthopedic, otolaryngology, urology, and plastic surgery. At the end of the study

period, general surgery had the second highest percentage of women among USMG entering surgery training (40%), behind obstetrics and gynecology (82%).

"The make-up of residents entering general surgery each year consists of medical graduates from the U.S. and abroad. By examining these populations separately, we were able to provide a more definitive analysis of those applying to, and entering, [general surgery](#) training," said Elisabeth C. Davis, MA, Education Research Associate, Division of Education, American College of Surgeons, and the study's lead author. "Further research should examine residency programs on a national scale with respect to factors suggested in previous studies that may be associated with women's decisions to enter surgery. These factors include the percentage of [women](#) on the surgical faculty, the presence of on-site childcare and policies regarding gender-based discrimination and maternity leave."
