

Too much protein HUWE1 causes intellectual disability

August 31 2012

Two to three percent of the children are born with an intellectual disability. Possibly by a genetic defect, but in 80% of these cases, we do not know – yet - which genes are responsible. VIB researchers at KU Leuven show that increased production of the HUWE1 protein is the cause in some patients.

Guy Froyen (VIB/KU Leuven): "The fact that HUWE1 regulates the dose of several other proteins in the brains, has an important impact on the quest for new therapies. It would then be possible to intervene in these different proteins. Research into the role of HUWE1 has already started in the lab."

Defects on the X-chromosome

[Intellectual disability](#) can be due to external factors such as [lack of oxygen](#) at birth or to defects in the [genetic material](#). In genetic (hereditary) causes, the exact identification of the defect is crucial for the [medical supervision](#) of the patient or to estimate the risk when having children. It is estimated that approximately 15% of patients have a defect that lies on the X-chromosome. This is called X-linked 'intellectual disability' (XLID). Despite extensive research, in half of XLID-patients, the responsible gene responsible has not yet been identified.

HUWE1 identified as culprit

Guy Froyen and his colleagues (VIB - KU Leuven) continue their research to find new [genes](#) that may cause XLID. Several years ago, they showed that the duplication of a fragment of the X-chromosome leads to a too high concentration of HSD17B10 and HUWE1 proteins.

Guy Froyen: "We knew then that these two proteins could play an important role in the (development of) the memory center in the brains, but we did not yet know which gene was the cause for the increased dose of XLID. Through additional research, including the DNA of 6 additional families from Europe, Australia and South Africa, we now know that HUWE1 is the crucial factor, and that a concentration increase of HUWE1 leads to intellectual disability. "

Consequences for detecting and treating XLMR

The research by Guy Froyen and his colleagues offers new perspectives for the detection and treatment of XLID. This allows for tests to be designed with which the duplication of and errors in HUWE1 are searched. For the development of a new treatment for XLID, further research is required. First of all, scientists must better understand the role of HUWE1 in the body, more specifically in the brains.
