

# Teduglutide seems effective, safe for short bowel syndrome

December 12 2012

---

For patients with short bowel syndrome with intestinal failure, the glucagon-like peptide 2 analogue teduglutide appears to be safe and reduces the number of days off parenteral support, according to a phase 3 study published in the December issue of *Gastroenterology*.

(HealthDay)—For patients with short bowel syndrome with intestinal failure (SBS-IF), the glucagon-like peptide 2 analogue teduglutide appears to be safe and reduces the number of days off parenteral support, according to a phase 3 study published in the December issue of *Gastroenterology*.

Palle B. Jeppesen, M.D., from Rigshospitalet in Copenhagen, Denmark, and colleagues conducted a 24-week study involving patients with SBS-IF who were given once-daily subcutaneous teduglutide (0.05 mg/kg/day; 43 patients) or placebo (43 patients). If 48-hour urine volumes exceeded baseline values by 10 percent or more, parenteral support was reduced.

The researchers found that at weeks 20 and 24 there were significantly more patients with >20 percent reduction in parenteral support volume from baseline among those in the teduglutide group (63 percent) compared with the [placebo group](#) (30 percent). The mean reduction in parenteral support volume at 24 weeks was  $4.4 \pm 3.8$  L/week and  $2.3 \pm 2.7$  L/week in the teduglutide and placebo groups, respectively. There was a significantly greater percentage of patients in the teduglutide group with a one-day or more reduction in the weekly need for parenteral support (54 percent) compared to the placebo group (23 percent). Plasma concentrations of citrulline, a [biomarker](#) of mucosal mass, increased with teduglutide. Treatment-emergent [adverse events](#) were similar between the two groups (two in the teduglutide group and three in the placebo group).

"Twenty-four weeks of teduglutide treatment was generally well tolerated in patients with SBS-IF," the authors write. "Treatment with teduglutide reduced volumes and numbers of days of parenteral support for patients with SBS-IF."

Several authors disclosed financial ties to NPS Pharmaceuticals and Nycomed, both of which funded the study.
