

'Laborist' obstetrical care improves pregnancy outcomes

February 11 2013

In a study to be presented on February 16 at the Society for Maternal-Fetal Medicine's annual meeting, The Pregnancy Meeting, in San Francisco, researchers will report findings that suggest shifting from a traditional model of obstetrical care to a laborist model improves pregnancy outcomes.

The "laborist" concept has been around for nearly a decade. In this model, obstetricians provide 24-hour a day on-site staffing of labor units. While it has been assumed that laborists improve obstetric care, there had been no studies done to test whether it does and how much it helps. Sindhu K. Srinivas, MD, MSCE and director of obstetrical services at the [Hospital](#) of the University of Pennsylvania, and her team worked with a non-profit organization, the National Perinatal Information Center and 24 of their member hospitals to determine the effectiveness of the laborist model.

"Many hospitals have moved toward adopting the laborist model, and it's critically important to determine whether it is improving [pregnancy outcomes](#)," explained Srinivas.

The study matched 8 laborist hospitals to 16 non-laborist hospitals accounting for location, volume of [deliveries](#), the presence of a neonatal ICU and teaching status.

"The hospitals selected were diverse in terms of volume with 30 percent of the data coming from hospitals with more than 5,000 births a year, 44

percent from hospitals with 2,500 to 5,000 births per year and 25 percent from hospitals with less than a 2,500 births per year," said Srinivas.

The study showed that using the laborist model resulted in 15 percent fewer labor inductions, reduced maternal length of stay (0.09 days), and a significant reduction in preterm delivery (17 percent).

"We thought the laborist model would improve pregnancy outcomes and now we have data that demonstrates that," said Srinivas. We need to do more research to understand the mechanism by which these outcomes are improved but this is a start."
