

Hospital hypoglycemia rates up in black men with diabetes

May 14 2013

Home diabetes regimens partially explain the increased risk of having a hypoglycemia event during hospitalization among older African-American men with diabetes, according to a study published in the April issue of *Clinical Diabetes*.

(HealthDay)—Home diabetes regimens partially explain the increased risk of having a hypoglycemia event during hospitalization among older African-American men with diabetes, according to a study published in the April issue of *Clinical Diabetes*.

Adline Ghazi, M.D., from the Medstar Good Samaritan Hospital in Baltimore, and colleagues used an automated research tool that searched electronic clinical data to identify all adults with type 2 diabetes 65 years of age and older admitted to medical or surgical wards between January 2006 and December 2009 (650 patients; 52.6 percent white and 47.4

percent African-American). Hypoglycemia was defined as blood glucose
