

No MI rate advantage for aggressive T2DM glucose control

August 1 2013

In patients with type 2 diabetes, more aggressive glucose-control strategies have variable short-term effects on microvascular complications, but they do not reduce the rate of myocardial infarction over four years of follow-up, according to a study published online July 22 in *Diabetes Care*.

(HealthDay)—In patients with type 2 diabetes, more aggressive glucose-control strategies have variable short-term effects on microvascular complications, but they do not reduce the rate of myocardial infarction over four years of follow-up, according to a study published online July 22 in *Diabetes Care*.

Romain Neugebauer, Ph.D., of Kaiser Permanente in Oakland, Calif., and colleagues conducted a cohort study involving 58,000 adults with type 2 diabetes who had A1C
