

Parents greatly underestimate how often their children are cyberbullied

October 25 2013

Cyberbullying has become a destructive force in many children's lives. After multiple suicides by children being cyberbullied, parents, more than ever, need to be aware of their children's online activity. A recent paper published in the *Journal of Computer-Mediated Communication* found that parents underestimate how often their children engage in risky online behavior, like cyberbullying and viewing pornography.

Sahara Byrne, Sherri Jean Katz, Theodore Lee (Cornell University), Daniel Linz (University of California – Berkeley), and Mary McIlrath (C+R Research) surveyed 465 parent-child pairs on their children's online behavior. They found that parents underestimate how often their child is a victim or perpetrator of [cyberbullying](#), exposed to sexual imagery, and approached by strangers online. The disparity between these behaviors and a parent's perception of the behavior increased when the parent executed a permissive style of parenting.

The study found that while 30% of youths admit to having been cyberbullied, only slightly higher than 10% of their parents reported that they knew. About 15% of the youths in the study admitted to cyberbullying others; under 5% of those parents were aware. The study also suggested that parents of younger teens – those who believe their child is smarter than others online, or who are not able to monitor their teen's internet use – are more likely to be unaware that their child has been cyberbullied.

Parents can take direct steps to helping protect their children online by

engaging in positive conversations about internet safety, moving the computer to a public place within the house, which works to varying degree depending on the child's access to the mobile internet. The best step is to open a line of communication with [children](#) so [parents](#) can increase their awareness of their online behavior.

"Youth believe that social media is their turf and they are somewhat correct," said lead author, Byrne. "Parents sometimes have no idea what their kids are doing online until it's too late."
