

FTO linked to BMI, BMI-for-age Z score in children

November 4 2013

(HealthDay)—For children from the Brazilian Amazon, *FTO* rs9939609 allele is associated with increased body mass index (BMI) and BMI-for-age Z scores, with the effect significantly modified by vitamin D status, according to a study published online Oct. 15 in *Diabetes*.

In an effort to examine the effect of *FTO* rs9939609 on BMI and BMI-for-age Z score changes, Barbara H. Lourenço, from the University of São Paulo in Brazil, and colleagues conducted a population-based longitudinal study involving 796 children from the Brazilian Amazon, aged younger than 10 years, who were followed for a median of 4.6 years.

The researchers found that, over follow-up, per rs9939609 risk allele there was a 0.07 kg/m²/year increase in BMI and a 0.03 Z/year increase

in BMI-for-age Z scores ($P = 0.01$). *FTO* effects were significantly modified by vitamin D status; among vitamin D insufficient (
