

New tool assesses quality of work relationships in the clinic

January 3 2014

The Work Relationships Scale seems to be a valid tool for measuring the quality of relationships in primary care settings, according to a study published in the November/December issue of the *Annals of Family Medicine*.

(HealthDay)—The Work Relationships Scale (WRS) seems to be a valid tool for measuring the quality of relationships in primary care settings, according to a study published in the November/December issue of the *Annals of Family Medicine*.

Erin P. Finley, Ph.D., M.P.H., from South Texas Veterans Health Care System in San Antonio, developed and validated a scale assessing relationships within [primary care](#) clinics (WRS) in 17 Department of Veterans Affairs (VA) primary care clinics (457 clinicians/staff surveyed). Validation included comparison against semi-structured clinic member interviews (247) and VA Survey of Healthcare Experiences of Patients (SHEP) data.

The researchers found that WRS scores were significantly associated with clinic-level reporting of the SHEP variables of overall rating of personal doctor/nurse (P

"Relationships play an important role in shaping care delivery and should be assessed as part of efforts to improve patient care within primary care settings," the authors write.
