

Preventive pediatric health care recommendations updated

February 24 2014

Recommendations for preventive pediatric health care have been updated, according to an American Association of Pediatrics policy statement published online Feb. 24 in *Pediatrics*.

(HealthDay)—Recommendations for preventive pediatric health care have been updated, according to an American Association of Pediatrics (AAP) policy statement published online Feb. 24 in *Pediatrics*.

Geoffrey R. Simon, M.D., from the AAP Committee on Practice and Ambulatory Medicine, and colleagues updated its recommended schedule of screenings and health assessments for well-child visits from infancy through adolescence.

According to the report, changes include use of a specific [screening tool](#) for alcohol and drug use in adolescents, as well as [depression screening](#)

at ages 11 through 21 years, using suggested screening tools. Screening for cholesterol at ages 9 and 11 has been added, as well as a risk assessment for hematocrit or hemoglobin at ages 15 and 30 months. HIV screening was added at age 16 to 18 years, but adolescents no longer require [routine screening](#) for cervical dysplasia until age 21. Before leaving the hospital, newborns should be screened for critical congenital heart disease using pulse oximetry.

"Each child and family is unique; therefore, these Recommendations for Preventive Pediatric Health Care are designed for the care of children who are receiving competent parenting, have no manifestations of any important health problems, and are growing and developing in satisfactory fashion," the authors write. "The AAP continues to emphasize the great importance of continuity of care in comprehensive health supervision and the need to avoid fragmentation of care."
