

# Report recommends insurers use prescription monitoring data to reduce opioid abuse, deaths

April 22 2014

---

The Prescription Drug Monitoring Program Center of Excellence at Brandeis University has issued a ground-breaking report recommending that medical insurers use prescription monitoring data to reduce the overdoses, deaths and health care costs associated with abuse of opioids and other prescription drugs.

"At a time when the misuse and abuse of prescription opioids has reached epidemic levels, it's important that third party payers be able to use states' prescription monitoring data to make sure these drugs are prescribed appropriately," said Peter Kreiner, principal investigator of the Prescription Drug Monitoring Program (PDMP) Center of Excellence.

The report, available online, describes the proceedings of a December 2012 meeting of more than 75 medical insurers, federal agency heads and state PDMP administrators, who explored the value and feasibility of PDMPs sharing its [prescription data](#) with third party payers.

"This report documents the emerging consensus among leaders in the insurance and workers' compensation industry that knowing the full prescription history of an insured patient will help to provide safe and effective care and keep costs under control," said John Eadie, PDMP Center of Excellence director.

The meeting was convened by the Center of Excellence as called for by the Office of National Drug Control Policy in its 2011 Prescription Drug Abuse Prevention Plan. It was funded by a grant from the U.S.

Department of Justice, Bureau of Justice Assistance Harold Rogers Prescription Drug Monitoring Program, which develops and encourages the adoption of PDMP best practices.

"With the support and expertise of the PDMP Center of Excellence and the PDMP Training and Technical Assistance Center at Brandeis University, almost every state in the country has a prescription [drug monitoring](#) program," said Congressman Hal Rogers of Kentucky.

"These important tools serve the dual function of promoting good medicine and effective law enforcement, and as co-chairman of the Congressional Caucus on Prescription Drug Abuse, I am heartened by efforts to expand access to PDMPs so that we can prevent the abuse and misuse of powerful medications."

As detailed in the report, meeting participants agreed that data sharing between PDMPs and third party payers would significantly enhance insurers' capability to monitor prescribing of opioids and other commonly abused [prescription drugs](#), permitting better detection of inappropriate prescribing and dispensing. Workgroups at the meeting formulated data sharing policies and procedures for consideration by regulatory agencies.

Most third party payers, including Medicare, Medicaid and workers' compensation programs, only see data on [prescriptions](#) for which their respective plans have paid. But PDMP data provide an individual's complete outpatient prescription history for controlled substances, including, for example, those for which a "doctor-shopping" patient or one acting in collusion with a street dealer had purchased for cash.

By enabling insurers to see their enrollees' activity beyond their

respective health plans, PDMP data also would provide payers with efficient—and most importantly with respect to patient safety—early identification of unscrupulous or otherwise dangerous controlled substance prescribing and dispensing.

"Opioid abuse is the most urgent issue in workers' compensation," said Bruce Wood, director of Workers' Compensation with the American Insurance Association. "Giving workers' compensation payers access to PDMP information would permit them to see if an injured worker is getting opioids from multiple sources."

"Prescription drug diversion is a serious problem across the U.S. that puts lives in jeopardy and costs consumers and insurers billions of dollars each year," added Dennis Jay, executive director of the Coalition Against Insurance Fraud.

"Sharing prescription monitoring data will help public and private insurers better detect abuse and fraud involving prescription drugs, and ultimately save money and lives."

The report will be discussed at the National Rx Drug Abuse Summit in Atlanta, Tuesday, April 22, 1:45-3 p.m., during the panel presentation on "PDMP Coordination with Third-Party Administrators."
