

Minnesota bans anti-bacterial chemical triclosan in soaps

May 21 2014

(HealthDay)—A bill to prohibit the use of triclosan in most retail consumer hygiene products was signed Friday by Gov. Mark Dayton and is scheduled to take effect Jan. 1, 2017. Minnesota is the first state to take such action, the *Associated Press* reported.

Studies in [lab animals](#) have suggested that triclosan may disrupt hormones that play an important role in reproduction and development, while other research indicates that triclosan may contribute to the development of drug-resistant bacteria. An estimated 75 percent of anti-bacterial soaps and body washes sold in the United States contain triclosan, according to the U.S. Food and Drug Administration. The agency and other experts say there's no evidence that soaps with triclosan

are more effective than plain soap and water in preventing the spread of diseases, the *AP* reported.

Other states and the federal government are likely to take action against triclosan, said state Sen. John Marty, one of the lead sponsors of the Minnesota bill. He added that many companies are likely to voluntarily remove triclosan from their products.

Extensive research has shown that [triclosan](#) provides important health benefits, according to the American Cleaning Institute, which urged Gov. Dayton to veto the bill, the *AP* reported.
