

The girl who couldn't stop laughing

June 17 2014

A six-year-old Bolivian girl presented with an unusual medical symptom: uncontrollable and inappropriate fits of laughter.

"She was considered spoiled, crazy, even devil-possessed," says Dr José Lidars Burgos Zuleta. Doctors diagnosed the child with "misbehaviour."

In a new research paper published in *ecancermedicalscience*, Dr Lidars Burgos successfully diagnosed the true cause of the little girl's gelastic, or laughing, seizures. Unable to perform a biopsy, his team turned to imaging to examine the girl's brain. They discovered a hamartoma – a small tumour pressing on the [temporal lobe](#) of her brain.

Dr Lidars Burgos hopes that this will assist other Latin American doctors in diagnosing the true cause of [behavioural issues](#) in children. "This case is interesting because these Latin American children will be referred to a neurologist," he says.

After surgery, the young girl is now healthy and developing normally. She has not suffered further seizures - and now only laughs for normal reasons.
