

# Care facility choice after hospital discharge about more than location, location, location

August 13 2014

---

Twenty-first-century patients typically don't stay in the hospital until they are completely well or totally healed. As hospitalization durations decrease, a significant number of older patients—about one in five—are discharged to skilled nursing facilities for continuation or closure of their care.

Deciding on the right post-discharge rehabilitation destination is important to future health and quality of life. However, it is a decision for which many patients and families are unprepared and unsupported, according to scientists from the Indiana University Center for Aging Research.

Choosing a facility that matches the level of the patient's care needs is difficult. How often does a physician see residents at a particular rehab facility? Can laboratory tests be done urgently, if needed? Patients often have multiple medical problems; is specialized care and equipment provided for such patients?

"More Than Just Location: Helping Patients and Families Select an Appropriate Skilled Nursing Facility," published online ahead of print in the *Annals of Long-Term Care*, lays out a roadmap to assist hospitals in providing the support that patients and families need to select a facility that offers what the patient requires to return to health.

"I am a primary-care physician," said the paper's first author, Arif Nazir, M.D., an IU Center for Aging Research scientist and associate clinical

professor of medicine at IU School of Medicine. "If I recommend knee surgery to a patient, I provide recommendations on physicians who I know do the procedure well. I don't say, 'You need surgery, so you should go out and find a doctor who operates on knees close to your or your daughter's home.' But that's really what often happens when patients are about to be discharged from hospitals and need to go to a rehab facility for continued care.

"Typically hospitals provide a list of institutions and, because of misinterpretation of government regulations and lack of information on various facilities, don't give advice. Not knowing what to do and often needing to make a quick decision, the choice is frequently made by the patient and family based on location or physical attractiveness of the facility. But for short-term post-hospital admissions, the facility needs to be selected on how well they can continue the care the patient received in the hospital."

According to Dr. Nazir, hospitals may over-interpret Social Security Act regulations, enforced by Centers for Medicaid Services. These regulations state that the selection of post-discharge destination is a free choice. This does not, he says, absolve hospitals of the responsibility of providing unbiased assistance in the selection of the most appropriate facility.

The paper, co-authored by Regenstrief Institute investigator Greg Arling, Ph.D., also of the IU Center for Aging Research and IU School of Medicine, and by Milta Little, D.O., of Saint Louis University School of Medicine, advocates patient-centered, [skilled nursing](#) facility selection taking into consideration such factors as disease severity and prognosis; patient insurance information; and quality of post-hospitalization services offered.

"Not being discharged to the right or right type of nursing home can

result in rehospitalization, which is bad for both the patient and the health care system," said Dr. Arling, a health services researcher who studies [health care](#) utilization. "We know that almost one-fourth of Medicare beneficiaries discharged from the hospital to a skilled [nursing facility](#) are readmitted to the hospital within 30 days, and we want to get this percentage down.

"Rehospitalization is difficult for any patient and especially older adults. Returning to the hospital puts them at greater risk for delirium, falls and infection."

"Hospitals are responsible for a safe transition to the next venue where the individual will receive post-acute rehab," Dr. Nazir said. "The discharge destination discussion needs to begin right away so families have time to visit the facilities." He also recommends consulting the checklist on the U.S. government website <http://www.medicare.gov/NHCompare> before making a placement decision.

Dr. Nazir is past president of the Indiana Society for Post-Acute Long-Term Care Medicine. He currently serves on the board of directors of The Society for Post-Acute and Long-Term Care Medicine, as does paper co-author Dr. Little.
