

Study: Wide hospital quality gap on maternity care

August 4 2014, by Ricardo Alonso-Zaldivar

A new study finds that where a woman delivers her baby can make a major difference to her own health.

Researchers comparing hospitals nationwide found that [women](#) who delivered at low-performing facilities suffered more than twice the rate of major complications for vaginal births.

For cesarean section deliveries, the disparity was even greater: nearly a fivefold difference.

The quality gap remains largely hidden from mothers-to-be.

There's no comprehensive source that women and their families can rely on to find the best hospitals ahead of time.

Medical groups are working on a consumer-friendly database that will use information from [electronic medical records](#). But that could take another three to five years.

The study is in Monday's issue of *Health Affairs*.
