

Chemo rx patterns changed before reimbursement changes

October 8 2014

(HealthDay)—Other factors may affect chemotherapy prescription patterns more than changes in Medicare reimbursement, according to a study published online Sept. 29 in the *Journal of Clinical Oncology*.

Mark C. Hornbrook, Ph.D., from Kaiser Permanente Northwest in Portland, Ore., and colleagues examined 5,831 chemotherapy regimens for 3,613 patients with [colorectal cancer](#) (CRC) or lung cancers from 2003 to 2006 (before and after the passage of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 [MMA], which took effect in 2005).

The researchers found that the odds of receiving an MMA-affected drug were lower in the post-MMA era (odds ratio [OR], 0.73), with differences by cancer type (OR for CRC, 0.65 [95 percent confidence

interval (CI), 0.59 to 0.89]; OR for [non-small-cell lung cancer](#) [NSCLC], 1.60 [95 percent CI, 0.46 to 0.92]; OR for small-cell [lung cancer](#), 0.63 [95 percent CI, 0.34 to 1.16]). Fee-for-service (FFS) patients were less likely to receive MMA-affected drugs following the MMA (OR, 0.73). Among integrated health network patients, no pre- versus post-MMA difference in the use of MMA-affected drugs was detected (OR, 1.01; 95 percent CI, 0.66 to 1.56).

"Changes in reimbursement after the passage of MMA appear to have had less of an impact on prescribing patterns in FFS settings than the introduction of new drugs and clinical evidence as well as other factors driving adoption of new practice patterns," the authors write.

Two authors disclosed financial ties to WellPoint.
