

Strict blood sugar control after heart surgery may not be necessary

October 1 2014

Patients undergoing coronary artery bypass grafting (CABG) surgery may not have to follow a strict blood sugar management strategy after surgery, according to a study in the October 2014 issue of *The Annals of Thoracic Surgery*.

Key points

- Liberal management of a patient's [blood sugar levels](#) following CABG surgery leads to similar survival and long-term quality of life as achieved through stricter blood sugar management.
- The findings applied to all patients, regardless of diabetes status.
- The results may encourage hospitals to consider more lenient blood sugar control in all patients after [heart bypass surgery](#).

Previous research has shown that hyperglycemia ([high blood sugar](#)) after CABG and other cardiac surgery is associated with increased morbidity and mortality; however, more recent studies have shown that liberal maintenance of [blood glucose levels](#) (
