

UN Ebola chief optimistic of future drop in cases

November 6 2014, by Edith M. Lederer

In a Sept. 3, 2014 file photo, David Nabarro, Senior United Nations System Coordinator for Ebola Disease, speaks at the United Nations Foundation in Washington. Nabarro said Thursday, Nov. 6, 2014, that the fight to contain Ebola is not even a quarter done, but the extraordinary global response in the last four weeks has made him hopeful the outbreak could end in 2015. The U.N.'s Ebola chief said an extraordinary global response over the past month has made him hopeful the outbreak could end in 2015,

though he cautioned that the fight to contain the disease is not even a quarter done.

"Until the last case of Ebola is under treatment, we have to stay on full alert," Dr. David Nabarro said in an interview with The Associated Press. "It's still bad."

Nabarro said a month ago that the number of Ebola cases was probably doubling every three-to-four weeks. He warned then that without a mass global mobilization, "the world will have to live with the Ebola virus forever" and that the response needed to be 20 times greater.

But in the past four weeks, the rate of Ebola infections seems to be slowing in some parts of West Africa, Nabarro said in the interview. In other hotspots, he said, it appears to be expanding the way it was a month ago.

Ebola has killed nearly 5,000 people in West Africa.

Nabarro said there are five times the number of beds for treatment in hardest-hit Sierra Leone, Liberia and Guinea than there were two months ago, helping to reduce the number of cases and improving efforts to find suspected infections and trace their contacts.

Nabarro pointed to two other positive signs: The extraordinary global response in the last month and the mobilization of local communities in the three countries as a result of massive media campaigns and house-to-house "sensitization efforts" involving traditional leaders.

He said these factors have "made me incredibly optimistic that in the coming months we could certainly see a diminution, and hopefully in the next year the outbreak will come to an end."

But Nabarro said it is too early to say the worst is over, noting that in Ebola and other diseases sometimes a reduction in cases can suddenly be followed by an upsurge, "like a fire reigniting."

"So I must stress to you that we are really not saying to the world that the job is even half done or a quarter done," he said.

"We're simply saying we had a strategy and the strategy predicted that as things got implemented, numbers of cases wouldn't increase at the rate they were increasing in August and September," Nabarro said. "Well, that's what's happening. We've in some places got a slowed rate of increase, but I'm afraid I cannot say to you that it looks as if we're over the worst."

He said more treatment facilities, community care centers and money are needed

The U.N. goal is to have 70 percent of cases isolated and 70 percent of burials safe by Dec. 1.

Nabarro said there has been "extraordinary progress" on burials in Liberia and the figure of safe burials is near 70 percent now. Touching and washing bodies are tradition at Liberian funerals, but authorities have launched campaigns warning such practices increase the risk of transmitting Ebola.

Nabarro said the other countries have farther to go but there are promising signs.
