

# Stem cell researchers develop promising method to treat sickle cell disease

March 9 2015, by Mirabai Vogt-James

---

UCLA stem cell researchers have shown that a novel stem cell gene therapy method could lead to a one-time, lasting treatment for sickle cell disease—the nation's most common inherited blood disorder.

Published March 2 in the journal *Blood*, the study led by Dr. Donald Kohn of the UCLA Eli and Edythe Broad Center for Regenerative Medicine and Stem Cell Research outlines a method that corrects the [mutated gene](#) that causes [sickle cell disease](#) and shows, for the first time, that the gene correction method leads to the production of normal [red blood cells](#).

People with sickle cell disease are born with a mutation in their beta-globin gene that causes blood stem cells—which are made in the bone marrow—to produce rigid red blood cells that resemble a crescent or 'sickle' shape. These abnormally shaped red blood cells do not move smoothly through blood vessels, resulting in insufficient oxygen to vital organs.

The stem cell [gene therapy](#) method described in the study seeks to correct the mutation in the beta-globin gene so bone marrow [stem cells](#) produce normal, circular-shaped blood cells. The technique used specially engineered enzymes, called zinc-finger nucleases, to eliminate the mutated genetic code and replace it with a corrected version that repairs the beta-globin mutation.

The research showed that the method holds the potential to permanently

treat the disease if a higher level of correction is achieved.

"This is a very exciting result," said Dr. Kohn, professor of pediatrics and microbiology, immunology and molecular genetics. "It suggests the future direction for treating genetic diseases will be by correcting the specific mutation in a patient's genetic code. Since sickle cell disease was the first human genetic disease where we understood the fundamental gene defect, and since everyone with sickle cell has the exact same mutation in the beta-globin gene, it is a great target for this gene correction method."
