

Local gin suspected of causing 18 mystery Nigeria deaths (Update)

April 20 2015

Ethanol poisoning from a locally brewed gin may have been responsible for the sudden death of 18 people last week, Nigerian health authorities said Monday.

"We strongly suspect ethanol poisoning and in view of this, we have ordered for another toxicology test for the surviving victims," Ondo state health commissioner Dayo Adeyanju told AFP.

Preliminary investigations ruled out viral or Ebola infection for the outbreak of the mysterious illness in the southwestern town of Ode-Irele on April 15.

"Our investigations revealed that five of the victims took local gin mixed with herbs. Three of them died while the other two have been put under close observation," Adeyanju said.

A total 23 people were affected, and 18 died.

The five others were referred to the Lagos University Teaching Hospital for further tests.

Adeyanju said the disease was not contagious, and that no new cases have been reported in the past four days.

"We will continue to monitor the situation. We are appealing to our people to report any case of sudden illness or death to the health

authorities for immediate action," he said.

Experts from the World Health Organization were in Ode-Irele to investigate and contain the disease.

The WHO representative in Nigeria, Dr Rui Gama Vaz, told reporters in Abuja on Monday that his organisation would continue to provide technical support to health authorities to battle the disease.

The global health body had said on Sunday that pesticide poisoning was the likely cause of the mysterious deaths.

The victims, whose symptoms included headache, weight loss, blurred vision and loss of consciousness, all died within a day of falling ill.
