

Study finds credentialed providers have greater knowledge of nutrition support practice

June 9 2015

Multidisciplinary health care professionals who hold the Certified Nutrition Support Credential (CNSC) scored significantly higher on a survey about their approaches to nutrition support practice than those who do not hold the credential according to new study.

The study, results of which were published today in the OnlineFirst version of the *Journal of Parenteral and Enteral Nutrition (JPEN)*, the research journal of the American Society for Parenteral and Enteral Nutrition (A.S.P.E.N.), was targeted to [health care professionals](#) affiliated with A.S.P.E.N.

The electronic survey used for the study included eight multiple choice knowledge questions that addressed evidence-based nutrition support practice issues for a patient with progressing pancreatitis.

Respondents with the CNSC answered 6.18 of eight questions correctly as compared to non-CNSC [respondents](#) who answered 4.56 questions correctly. For all eight questions, CNSC respondents were significantly more likely to choose the correct answer as compared to non-CNSC respondents. The fact that the CNSC respondents answered 20% more of the questions correctly is a clinically meaningful difference considering each question addressed a specific safe nutrition support practice. The majority of those who took the survey were dietitians (70.8 percent) in nutrition support practice for 10 years, and 29 percent held

the CNSC.

Based on these results, the researchers recommend that future research should explore the benefit of the CNSC on safe and efficacious nutrition support care by evaluating changes in patient care outcomes in [health care](#) settings.
