

# Suspected Zika-linked birth defect on French island

March 22 2016

---

French authorities said Tuesday there was "a very strong suspicion" that the first case of microcephaly linked to the Zika virus had been detected on the Caribbean island of Martinique.

The case would be the first on French territory of microcephaly, a [birth defect](#) thought to be caused by Zika, the mosquito-borne virus that has spread rapidly through South America.

French Health Minister Marisol Touraine said a total of 130 pregnant women had been diagnosed with the Zika virus in the Antilles islands, which include Martinique, as well as French Guiana on the South American mainland.

"For one of them, we have elements that lead us to believe her baby has contracted microcephaly and that this microcephaly is directly linked to her infection with the Zika virus," said Touraine.
