

Study shows sleep disturbances common among military spouses

June 8 2016

A new study found that spouses of military service members experience significant sleep problems, which can impact their health and psychosocial functioning.

Results show that 44 percent of [spouses](#) reported sleeping 6 hours or less per night. Approximately 54 percent of the sample endorsed daytime impairment due to [sleep problems](#), and 62 percent reported experiencing daytime fatigue at least 1-2 times per week. Spouses of currently or previously deployed service members endorsed poorer sleep quality and more fatigue than spouses of service members who had never deployed.

"These results are important because we know very little about sleep problems among military spouses. Promoting [sleep health](#) may be an important strategy for enhancing military families' adjustment in the post-deployment period," said principal investigator Wendy Troxel, PhD, senior behavioral and social scientist at the RAND Corporation. "This is particularly relevant given that the past 14 years of protracted overseas combat have exacted an unprecedented toll on U.S. service members and their families."

The research abstract was published recently in an online supplement of the journal Sleep and will be presented Sunday, June 12, in Denver at SLEEP 2016, the 30th Anniversary Meeting of the Associated Professional Sleep Societies LLC (APSS).

The study group comprised 1,480 female spouses of [military service](#)

[members](#) who completed self-report instruments related to [sleep](#), physical health, marital satisfaction, and depression. Information regarding service member military characteristics (e.g., branch of service, deployment history) was also available.
