

Dulaglutide, glargine plus lispro improve glycemic control

June 20 2016

(HealthDay)—Dulaglutide and glargine in combination with prandial

lispro are associated with a similar percentage of time spent in the normoglycemic range, according to a study published online June 9 in *Diabetes, Obesity and Metabolism*.

Johan Jendle, M.D., Ph.D., from Örebro University in Sweden, and colleagues randomized 884 conventional insulin regimen-treated patients to dulaglutide 1.5 mg, dulaglutide 0.75 mg, and glargine, in combination with prandial insulin lispro. In a continuous [glucose](#) monitoring (CGM) substudy, 144 patients were inserted with a Medtronic CGMS iPro CGM device to enable three-day glucose monitoring.

The researchers found that mean CGM glucose decreased in all treatment groups (dulaglutide 1.5 mg and 0.75 mg, and glargine) at week 26; the differences between groups were not statistically significant. The percentage time in 3.9 to 7.8 mmol/L range was similar for all treatment groups. The percentage time in 3.9 to 10.0 mmol/L range was greater for dulaglutide 1.5 mg versus glargine (P

"In combination with prandial lispro, [treatment](#) with dulaglutide and glargine resulted in similar proportions of glucose values in the normoglycemic range, but dulaglutide provided an improved balance between the proportion of values within the near-normoglycemia range and values within the hypoglycemic range," the authors write.

Several authors disclosed financial ties to biopharmaceutical companies, including Eli Lilly, which manufactures dulaglutide and funded the study.
