

Mexico joins Philippines, Brazil with dengue vaccine

September 10 2016

While the world awaits a Zika vaccine, the first ever injection against dengue fever is spreading, with Mexico becoming next week the latest country where people can get the shot.

French pharmaceutical giant Sanofi is presenting its Dengvaxia vaccine to doctors at an event in eastern Mexico on Saturday, while people aged nine to 45 will be able to get the shot from their physicians from Monday.

After public programs were launched in the Philippines and Brazil's state of Parana this year, the company is rolling out the vaccine in the private sector in Mexico while [health authorities](#) prepare a public immunization plan.

The head of Sanofi's [dengue](#) program, Guillaume Leroy, told AFP in Mexico City that the company already has one million doses ready in the country.

Leroy said it was difficult to estimate how much the vaccine will cost in Mexico as it will depend on the distribution networks and the public vaccination program.

The mosquito-borne virus costs governments around the world \$18 billion a year, Leroy said.

"We estimate that in Mexico and in other countries that the benefits will

outweigh the costs of the (vaccine) intervention," he said.

The company will have a "fair policy throughout the world and affordable for health authorities."

Zika vaccine

Mexico was the first country in the world to give regulatory approval to the vaccine in December last year. Seven others followed suit, including Brazil, Costa Rica, El Salvador, Guatemala, Paraguay, Peru and the Philippines.

Sanofi is awaiting authorizations in 18 other countries.

The fast-growing disease infects as many as 400 million people every year, according to the World Health Organization (WHO), which has endorsed the vaccine.

Sanofi's research and development work took 20 years, costing more than 1.5 billion euros (\$1.7 billion).

Now, Sanofi and other pharmaceutical firms are racing to find a weapon against Zika, which like dengue is carried by the *Aedes aegypti* mosquito.

"Developing a vaccine against Zika will be easier after developing a vaccine against dengue," Leroy said, noting that the viruses share genetic similarities.

"All these investments (on dengue) through more than 100 collaborations worldwide allow us today to gain a lot of time on different vaccinal approaches" against Zika, he said.

Some 70 countries and territories have reported local mosquito-borne Zika transmission, with Brazil by far the hardest hit and the WHO declaring it a public health emergency.

Zika causes only mild symptoms for most people such as fever and a rash, but infected pregnant women can give birth to babies with microcephaly, a deformation marked by abnormally small brains and heads.

Vaccine concerns

Scientists had also long been stumped by dengue, which has four separate strains, forcing researchers to find a drug able to fight all of them at once.

Dengue can trigger a crippling fever, along with muscle and joint pain.

But clinical tests on 40,000 people from 15 countries found Dengvaxia can immunize two thirds of people aged nine years and older, rising to 93 percent for the more severe form of the disease, [dengue hemorrhagic fever](#).

It was also found to reduce the risk of hospitalization by 80 percent.

Brazil launched a public immunization program for 500,000 people in Parana in August, while the Philippines has injected 489,000 public school children aged nine since it became in April the first country to use the vaccine.

Philippines health department spokesman Eric Tayag said authorities followed WHO recommendations, which say it should not be given to children under nine years old.

"We are tracking each child" to look for any sign of dengue or side effects, Tayag said.

Some scientists have voiced concerns about studies showing that the vaccine could give dengue to people who have never had the virus.

Scott Halstead, founder of the Pediatric Dengue Vaccine Initiative, told AFP that the WHO was "being hasty" in recommending the vaccine and that people should be tested to see if they have had dengue before being vaccinated.

"It's not ethical to give a vaccine that harms someone," Halstead said.

But Leroy noted that Dengvaxia, in addition to the WHO's green light, is getting approval from government health regulators.

"It is a great solution and the first solution because dengue did not have until now any specific medial solution to treat this illness," Leroy said, adding that Sanofi is conducting studies in Asia among younger people to see if the [vaccine](#)'s reach can expand.
