

Nurse practitioners step in to fill growing need for house calls

January 23 2017

Researcher Nengliang 'Aaron' Yao, Ph.D., of the University of Virginia School of Medicine, says revisiting state regulations of nurse practitioners could help fill the growing need for house calls. Credit: Dan Addison, UVA

Nurse practitioners are increasingly providing house calls for frail and

elderly patients, eclipsing any other specialties in number of home visits in 2013, new research reveals. However, regulations are hindering the profession's growth in many states even as demand for in-home care climbs, one researcher reports.

Geriatric Needs

In 2013, nurse practitioners provided more than 1.13 million home visits, surpassing the 1.08 million made by internal medicine doctors, the new study found. That's the reverse of 2012, when [internal medicine](#) docs made 1.08 million visits and nurse practitioners made fewer than 925,000.

"This has implications for both house-call providers and nursing education," said researcher Nengliang "Aaron" Yao, PhD, of the University of Virginia School of Medicine's Department of Public Health Sciences. "If we want to take care of our geriatric population, we really need more providers to do so."

The number of new doctors licensed each year is capped by the number of medical residencies available, but there is no such limit on nurse practitioners. But regulations in many states are limiting the growth of that field as well, Yao said. By revisiting those rules, he said, state governments could help address some of their residents' unmet medical needs. "If we want to improve geriatric care and reduce rural disparities, that's where we should go," he said.

In addition to suggesting that states re-examine their regulations, Yao also recommends that nursing schools offer training programs in home-based primary and palliative care.

Quantifying House Calls

Yao and colleagues at the UVA School of Nursing, Virginia Commonwealth University and the University of Tennessee reviewed Medicare data to learn how many house calls were made in 2012 and 2013, who made them and where they took place. The total number of [home visits](#) made by all specialties grew from 4.9 million to almost 5.2 million, they found.

Nurse practitioners, the researchers determined, provided care over the largest geographic area. The bulk of [nurse practitioners](#) who made more than 1,000 house calls in 2013 were in the eastern half of the United States, with the strongest concentration in the Northeast. Nursing home residents were far more likely to receive [house calls](#) than were homebound people still living in their own residences.

"One wonders if this apparent disparity is connected to the financial model that supports medical care of these populations and the comparative efficiency and convenience of seeing many patients in one building," the researchers write in a new article outlining their findings. "To some extent, relative lack of services in the Midwest and West may relate to population density, though even in Western locations with high population density there is a relative lack of billed Medicare activity, which is not explained but bears further study."

The findings have been published in the *Journal of the American Geriatrics Society*.
