

Extra weight may increase dental risks

May 17 2017

Being overweight or obese was linked with an increased likelihood of having poor oral health in a recent study.

In the study of 160 participants, those with BMI ?23 had generally more severe periodontitis, total inflammatory dental diseases, and leukocyte counts than <u>normal weight</u> individuals. Patients who were obese (BMI ?25) had almost a 6-times increased risk for severe periodontitis compared with normal weight participants. Altered inflammatory molecules that are associated with <u>obesity</u> may play a role.

The results are published in Oral Diseases.
