

Change in conversion definition may improve TB detection

August 4 2017

(HealthDay)—A change of QuantiFERON-TB interferon (IFN) γ values

from 0.7 IU/mL is associated with an increased incidence in the rate of tuberculosis, according to a study published online July 24 in the *American Journal of Respiratory and Critical Care Medicine*.

Elisa Nemes, Ph.D., from the University of Cape Town in South Africa, and colleagues assessed sources of QuantiFERON-TB variability and identified optimal procedures. The authors analyzed distributions of IFN γ response levels in healthy adolescents, *Mycobacterium tuberculosis* (*M.tb*)-unexposed controls, and pulmonary tuberculosis patients.

The researchers found that IFN γ values were
