

Infant mortality disparity grows in Appalachia, study finds

August 7 2017

A new study shows a growing disparity between infant mortality and life expectancy rates in Appalachia compared with the rest of the country.

The study was published in the August issue of *Health Affairs*. It compared infant mortality and life expectancy rates in Appalachia with the rest of the United States between 1990 and 2013.

The study found that while the [infant mortality](#) rate in Appalachia was close to that of the rest of the country in 1990, by 2013 the rate 16 percent higher in the 13-state region. Also, the study found life expectancy in Appalachia to be about 2.4 years less than the rest of the country.

The study blamed the disparity on a number of issues, including smoking, drug use and accidental deaths such as car accidents.
