(HealthDay)—As people return to flood-affected homes in the wake of Hurricane Harvey, they need to take precautions to stay safe and healthy, the American Thoracic Society (ATS) says.

The massive storm left hundreds of thousands of homes and businesses in southeast Texas flooded and about 50,000 people displaced.

Each year, there are more than 150 flood-related deaths in the United States and many of those deaths occur from electrocution, [carbon monoxide poisoning](#) or other accidents when residents return to flooded homes.

In such situations, electricity and gas should be turned off immediately to avoid shocks and [gas leaks](#), the ATS advised.

All mud and water that has entered the home should be considered contaminated. Wear protective equipment such as masks, gloves and glasses until cleanup is complete.

Soiled or saturated porous materials such as carpets and furniture should be thrown away to prevent mold and other microbial growth.

Solid materials can be cleaned with water and detergent. Be extremely cautious if using bleach, read and follow labels on household cleaners, and do not mix them together.

Pregnant women, young children, the elderly and people with weakened immune systems are particularly susceptible to infectious complications that can occur in flooded areas and should stay away until cleanup is complete.

Mold growth may be especially dangerous for people with pre-existing allergic or other respiratory disease, according to the ATS.

People who develop new health symptoms during flood cleanup should seek medical care as soon as possible.

If you know or suspect that your home contains lead or asbestos, do not begin cleanup without first calling (800) 424-LEAD or the EPA Toxic Substances Control Act (TSCA) Assistance Service at (202) 554-1404 for asbestos.
