

How to survive a New Year's hangover

December 29 2017

(HealthDay)—Excess drinking on New Year's Eve can lead to a painful morning after, with no sure-fire cure available. But helpful strategies for treating a hangover do exist.

Hangover symptoms—[headache](#), nausea and dizziness—occur when the body withdraws from alcohol and a chemical called acetaldehyde is produced, Dr. Robert Glatter, an emergency physician at Lenox Hill Hospital in New York City, said in a hospital news release.

The only "cure" at present is to not imbibe in the first place. Glatter said that the U.S. Food and Drug Administration has not approved any treatments for a [hangover](#) and isn't likely to do so anytime soon.

Instead, he offered these suggestions:

- Drink in moderation, and eat before you drink. That's because the food will slow the absorption of the alcohol. A meal with high levels of protein and fat may do an especially good job of slowing the alcohol absorption process.
- Snack throughout the evening and night to slow the absorption of [alcohol](#). This also helps keep your [blood sugar levels](#) steady.
- Be cautious around darker alcohols, such as red wine, bourbon and whiskey. They contain more toxic chemicals, called congeners, that are produced during the fermentation process. These can boost the risk of a hangover headache.
- To reduce the impact of a hangover headache, take a nonsteroidal anti-inflammatory painkiller before going to bed. Examples are aspirin, Advil and Aleve.
- Drink slowly and make every other drink a non-alcoholic beverage, like water. Also consider drinks like Powerade and Gatorade, which can restore your body's electrolyte levels.
- If you develop a hangover headache, try [drinking](#) the soft drink Sprite, which contains a compound called taurine that may be helpful.

There's one other important thing to remember the morning after: Watch out for caffeine because caffeinated drinks can boost your heart rate and

worsen dehydration, Glatter said.
