

Dose-escalated radn does not up survival in localized prostate CA

March 16 2018

(HealthDay)—Dose escalation from 70.2 to 79.2 Gy is not associated

with improved overall survival (OS) in intermediate-risk prostate cancer, according to a study published online March 15 in *JAMA Oncology*.

Jeff M. Michalski, M.D., from Washington University in St. Louis, and colleagues randomized 1,532 men with stage cT1b to T2b, Gleason score 2 to 6, and [prostate-specific antigen](#) (PSA) level of ≥ 10 and
