

# Patients do as well on generic antiplatelet drugs as more expensive brand-name product

March 13 2018

---

Generic anti-platelet drugs seem to work as well as a brand name drug for heart patients, according to new research in *Circulation: Cardiovascular Quality and Outcomes*, an American Heart Association journal.

When a Canadian health system switched from prescribing the brand-name anti-platelet drug Plavix to a far-cheaper generic version, [heart-attack](#) and chest pain [patients](#) were no more likely to die from any cause or be re-hospitalized for a [heart](#) attack or unstable angina within a year than those prescribed Plavix (17.9 percent vs. 17.6 percent).

In addition, there were no significant differences between the drug groups in the percent of patients who died or were hospitalized for any reason; had a stroke or [transient ischemic attack](#); or who developed bleeding as a side effect of treatment.

"People can safely use generic clopidogrel. This large and real-world study should be reassuring to physicians and healthcare organizations who have been concerned about changing what is prescribed," said Dennis T. Ko, M.D., M.Sc., lead study author and senior scientist at the Institute for Clinical Evaluative Sciences (ICES) in Toronto.

In Canada and the United States, generic drugs are approved based on small studies in healthy people showing that the active ingredient is released at equivalent levels and over the same timeframe. That suggests, but doesn't prove, that the generic product will also have the same safety

and medical benefit.

Clopidogrel is used to treat patients with [acute coronary syndrome](#), [percutaneous coronary intervention](#), stroke or peripheral vascular disease.

Researchers compared outcomes in patients (average age 77, 57 percent male) who were prescribed clopidogrel after hospitalization for a heart attack or heart-related chest pain (unstable angina) in Ontario, Canada, where the Ministry of Health began to automatically substitute generic clopidogrel for Plavix once the brand name drug's patent expired in 2012. Between 2009 and 2014, 12,643 patients were prescribed Plavix and 11,887 generic clopidogrel.

Plavix cost about \$2.58 Canadian dollars per pill in 2010 and was projected to cost the Ontario Drug Benefit Program \$72.8 million by 2012. But by switching to a generic, which costs \$0.39 per pill in 2018, the expense was only \$19 million Canadian dollars.

"Plavix was one of the most commonly used drugs in cardiology, so switching to generics can reduce a lot of cost for individuals and health systems," said Ko, who is also a cardiologist at the Schulich Heart Centre of the Sunnybrook Health Sciences Centre at the University of Toronto.

While the study was conducted in Canada, the results should apply to the United States, even if the generic [drug](#) offerings are slightly different, according to the researchers.

"There are quite a few different generic brands. In this study, we considered them as a group, but later found no differences in outcome when we compared between different generics," said co-principal investigator Cynthia Jackevicius, Pharm.D., M.Sc., professor of pharmacy at Western University of Health Sciences and senior adjunct

scientist at ICES.

The American Heart Association recommends clopidogrel—sometimes in combination with other drugs—for patients who have had acute coronary syndrome ([unstable angina](#) or heart attack) or stroke.
