

Myocarditis rare side effect of immune checkpoint inhibitors

April 6 2018

(HealthDay)—Myocarditis in patients treated with immune checkpoint

inhibitors (ICIs) may be more common than previously thought, according to a study published online March 19 in the *Journal of the American College of Cardiology*.

Syed S. Mahmood, M.D., M.P.H., from the New York-Presbyterian Hospital in New York City, and colleagues used data from an eight-site registry of 35 [patients](#) with ICI-associated myocarditis (November 2013 to July 2017). Medical records were used to understand the presentation and clinical course of ICI-associated myocarditis.

The researchers found that the prevalence of myocarditis was 1.14 percent, with a median time of onset of 34 days after starting ICIs. Case characteristics included an average age of 65 years, 29 percent female, and 54 percent had no other immune-related side effects. Combination ICI (P

"Myocarditis after ICI therapy may be more common than appreciated, occurs early after starting treatment, has a malignant course, and responds to higher steroid doses," the authors write.

Several authors disclosed financial ties to the pharmaceutical industry.
