

E.coli in reblochon cheese sends six French children to hospital

May 14 2018

French authorities ordered a recall of reblochon cheeses on Monday after six young children were hospitalised with E.coli infections traced to a producer.

One of the children, who ranged from 18 months to three years old, was still in hospital after eating the raw-milk cheeses made by Chabert at its site in Cruseilles, eastern France.

The agriculture and health ministries said in a joint statement that reblochon cheeses made at the site, sold under a variety of brands, were being recalled "as a precautionary measure".

The recall was first announced Friday but only involved Chabert cheeses sold by the Leclerc supermarket chain under an in-house brand.

The hospitalised [children](#) had begun having kidney complications, while a seventh child was also infected but did not require additional treatment.

"Investigations are continuing at the company and with its milk suppliers to determine the exact source of the E.coli O26 contamination," the ministries said, referring to the specific strain of the potentially fatal bacteria.

Authorities also urged parents not to let [young children](#) eat raw-milk [cheese](#), just a few weeks after a recall of camembert cheeses following

inspections at a producer which revealed E.coli contamination, though no illnesses were reported.

The reblochon recall comes as US authorities battle the biggest E.coli outbreak since 2006, warning people not to eat romaine lettuce unless they are certain of its origin after dozens of people got sick, including one person who died.
