

CHOP nurse-researcher presents the Spatz 10-Step System as national model for breastfeeding

July 31 2018

Dr. Diane Spatz is a nurse researcher and director of the Lactation Program at Children's Hospital of Philadelphia Credit: Children's Hospital of Philadelphia

Mothers of critically ill infants may not receive necessary breastfeeding support, because their babies may be taken directly to a newborn

intensive care unit or to surgery. Dr. Diane Spatz, Nurse Researcher & Director of the Lactation Program at Children's Hospital of Philadelphia (CHOP), presents an alternative model for health care providers that focuses on serving the needs of vulnerable infants who are hospitalized and separated from their mothers.

Many of these newborns are born preterm or with birth defects or other critical conditions. Spatz drew on her own extensive clinical experience and on research findings from the National Institutes of Health to create the Spatz 10-Step and Breastfeeding Resource Nurse Model to Improve Human Milk and Breastfeeding Outcomes which can guide all health professionals. The research was recently published in the April/June 2018 edition of the *Journal of Perinatal and Neonatal Nursing*, for which Dr. Spatz also served as guest editor.

The 10-Step Model consists of informed decision, establishment and maintenance of milk supply, human milk management, oral care and feeding of [human milk](#), skin-to-skin care, non-nutritive sucking, transition to breast, measuring milk transfer, preparation for discharge and appropriate follow-up. The 10-step model has been implemented for more than 10 years at CHOP, as well as in other [neonatal intensive care](#) units across the U.S. and around the world.

"Because nurses are the largest health profession globally and in the U.S., nurses should play a critical role in providing evidence-based lactation care and support," said Spatz. "At CHOP, we developed a specialized educational and training program so that nurses across the institution could implement the 10-step model effectively."

The Baby-Friendly Hospital Initiative (BFHI) was established in 1991 as a worldwide program to incentive maternity facilities to adhere to the Ten Steps to Successful Breastfeeding and comply with the International Code of Marketing of Breast Milk Substitutes. The U.S. has only

recently seen an increase in hospitals seeking BFHI designation, and globally the number of BFHI facilities is less than 10 percent. BFHI focuses primarily on healthy mother-infant pairs.

"Our research demonstrates that nurses at CHOP are empowered through the Breastfeeding Nurse Program and they strive to advocate for [breastfeeding](#) families and support their peers in delivering optimal, evidence-based lactation care and support as part of their daily practice," Spatz added.
