

Poison parsnip causes severe burns, blisters on woman's legs

July 18 2018

A woman was left with severe burns and blisters on her legs after encountering an invasive species of plant in Vermont.

Charlotte Murphy says she developed painful blisters overnight after brushing against poison parsnip. Murphy says the blisters got so bad she had to go to the hospital to see a burn specialist.

The Essex woman learned her injuries were comparable to second-degree burns and were caused by the invasive plant.

David Grass of the Vermont Department of Health says the sap in the parsnip has a chemical reaction with the sun that causes accelerated burns. He says people should wear long pants and sleeves while in tall grass.

Murphy says she hopes her experience helps educate people.
