

Few published programs address medical trainee mistreatment

July 31 2018

(HealthDay)—There are very few published descriptions of programs

that address the mistreatment of medical trainees, according to a review published online July 27 in *JAMA Network Open*.

Laura M. Mazer, M.D., from Stanford University School of Medicine in California, and colleagues conducted a [systematic review](#) to document the programmatic and curricular attempts to reduce the incidence of mistreatment of medical students. Ten studies met the inclusion criteria.

The researchers found that all the programs included in the 10 studies were implemented in [academic medical centers](#). The most common program format included lectures, workshops, and seminars over a variable period of time. The quality of included studies was low and a conceptual framework was included in only one study. Outcome evaluations of the programs mainly consisted of surveys and reports of mistreatment. Participant satisfaction was assessed in all studies and was mainly qualitative. The [frequency](#) of mistreatment reports was included in seven studies, with surveys to assess the perception of mistreatment frequency or the frequency of reports via official reporting channels. Five *MedEdPORTAL* mistreatment program curricula were identified, two of which presented outcome data.

"There are very few published programs attempting to address mistreatment of medical trainees," the authors write. "This review identifies a gap in the literature and provides advice for reporting on mistreatment programs."
