

How bad bacteria gain an edge in the gut

September 11 2018

The bacterium *Clostridium difficile*, which is responsible for the majority of antibiotic-associated diarrhea outbreaks worldwide, produces a unique compound called p-cresol to gain a competitive

advantage over natural protective gut bacteria. The findings were reported by Lisa Dawson and Team at the London School of Hygiene and Tropical Medicine and colleagues on September 11 in the open-access journal *PLOS Pathogens*.

Antibiotics disrupt the natural protective gut flora, rendering people susceptible to *C. difficile* infection, which leads to potentially life-threatening disease and complications. Currently, there is a great need to better understand how *C. difficile* is able to influence the [gut microbiota](#) and disrupt intestinal homeostasis. One clue to this question is that *C. difficile* is one of only 18 intestinal commensal species known to produce p-cresol, which inhibits the growth of a broad range of microorganisms but only affects *C. difficile* at relatively high concentrations.

Dawson and colleagues now show for the first time that the production of p-cresol by *C. difficile* confers a fitness advantage over other gut bacteria. Experiments in mice showed that p-cresol selectively targets certain bacteria in the gut and disrupts their ability to grow, leading to significant alterations in the intestinal microbiota. Moreover, mutant *C. difficile* strains that could not produce p-cresol were less capable of recolonizing the gut after initial infection. The findings suggest that p-cresol production contributes to *C. difficile* survival and pathogenesis.

Dawson notes, "we have identified that the major gut pathogen *Clostridium difficile* produces the bacteriostatic agent para-cresol which helps control the intestinal microbiota and provides *C. difficile* with a competitive growth advantage particularly after the consumption of antibiotics. This unique attribute of the pathogen may provide a novel drug target to reduce *C. difficile* infection."
