

## **CDC: HPV vaccination rates increasing among adolescents**

September 5 2018

---

(HealthDay)—Human papillomavirus (HPV) vaccination coverage

increased 5.1 percentage points from 2016 to 2017, and there was also an increase in the number of adolescents up to date with HPV vaccinations, according to research published in the Aug. 24 issue of the U.S. Centers for Disease Control and Prevention's *Morbidity and Mortality Weekly Report*.

Tanja Y. Walker, M.P.H., from the CDC in Atlanta, and colleagues analyzed data from the 2017 National Immunization Survey-Teen for 20,949 adolescents aged 13 to 17 years to estimate adolescent vaccination coverage.

The researchers found that coverage increased for one or more dose of HPV vaccine (60.4 to 65.5 percent), one or more dose of [meningococcal conjugate vaccine](#) (MenACWY; 82.2 to 85.1 percent), and two or more doses of MenACWY (39.1 to 44.3 percent) from 2016 to 2017. Tetanus and reduced diphtheria toxoids and acellular pertussis vaccine (Tdap) coverage remained stable at 88.7 percent. Compared with 43.4 percent in 2016, 48.6 percent of adolescents were up to date with the HPV [vaccine](#) series in 2017. There was also an increase in on-time vaccination.

"Although HPV vaccination initiation remains lower than coverage with MenACWY and Tdap, HPV vaccination coverage has increased an average of 5.1 percentage points annually since 2013, indicating that continued efforts to target unvaccinated teens and eliminate missed vaccination opportunities might lead to HPV vaccination [coverage](#) levels comparable to those of other routinely recommended adolescent vaccines," the authors write.
