

Cholera outbreak in Nigeria claims nearly 100 lives

September 22 2018

A cholera outbreak in north-eastern Nigeria has claimed nearly 100 lives over the past two weeks, the United Nations said Saturday.

More than 3,000 [cholera](#) cases have been recorded in the states of Yobe and Borno in a region that is also grappling with a Boko Haram insurgency, it said.

"The cumulative number of recorded cases in both states currently stands at 3,126 including 97 deaths," the UN Office for the Coordination of Humanitarian Affairs (OCHA) said.

The [outbreak](#) was declared two weeks ago in restive Borno, where hundreds of thousands of displaced people live in camps.

Boko Haram has intensified attacks, especially against military targets in recent months.

On Wednesday, the UN reported that more than 500 people had died from cholera in the Lake Chad region since the start of the year, representing the worst outbreak to hit the area in four years.

It said more than six million people could be affected by the outbreak without urgent action to control it.

Expected floods and heavy rains were "an ideal environment for the outbreak to spread", OCHA warned.

The Lake Chad region straddles parts of Nigeria, Cameroon, Chad and Niger, which are also having to deal with a jihadist insurgency.

OCHA said Nigeria, Africa's most populous nation, was the worst-hit with 24,000 cases overall, and said immediate action was needed to stem the disease.

Cholera is caused by a bacterium transmitted through contaminated food or drinking water. It causes [acute diarrhoea](#), with children particularly at risk.

Water-borne diseases are a constant threat in the Lake Chad region because of a lack of adequate sanitation as well as stagnant groundwater during the rainy season.
