Journal of Medicinal Food

Researchers have identified a new mechanism involving ginsenoside Rb1, which has the ability to stimulate keratinocyte migration and promote cutaneous wound healing. They report the results of a study showing that Rb1 enhances keratinocyte migration in an article published in *Journal of Medicinal Food*, a peer-reviewed journal from Mary Ann Liebert, Inc., publishers. The researchers demonstrated that Rb1 significantly increases the production of sphingosine-1-phosphate (S1P), which is a signaling factor in keratinocytes known to stimulate wound repair through greater keratinocyte migration.
