Researchers have discovered a new use for an old drug as a potential treatment for prostate cancer. The findings are published in the journal *The Prostate*.

Since the 1940s, androgens have been linked to [prostate cancer](#), and decades of work since have focused on [androgen receptor](#) (AR), a nuclear receptor transcription factor. Although AR drives prostate

cancer, inhibiting it induces remission for only a short time. Investigators have found that a drug approved for the treatment of amyotrophic lateral sclerosis—called riluzole—promotes the degradation of AR through a distinct pathway.

The findings suggest that riluzole should be investigated clinically for prostate cancer and predict that it may be effective for both [early stage](#) and advanced disease," said senior author Dr. Shahriar Koochekpour, of Roswell Park Comprehensive Cancer Center.

**More information:** Kristine M. Wadosky et al, Riluzole induces AR degradation via endoplasmic reticulum stress pathway in androgen-dependent and castration-resistant prostate cancer cells, *The Prostate* (2018). [DOI: 10.1002/pros.23719](https://doi.org/10.1002/pros.23719)
