

Are there geographic disparities in death due to traumatic brain injury for US veterans?

November 7 2018

There are known racial and ethnic disparities in death due to traumatic brain injury (TBI) and a new study has now examined if there is an association between TBI mortality and where a U.S. veteran lives. The study showed that, among veterans with TBI, mortality was higher for those living in the U.S. territories compared to the mainland, as reported in an article published in *Health Equity*.

The article entitled "Geographic Disparities in Mortality Risk within a Racially Diverse Sample of US Veterans with Traumatic Brain Injury" was coauthored by Clara Dismuke-Greer, Ph.D. and colleagues from Ralph H. Johnson Department of Veterans Affairs Medical Center (Charleston, SC), Medical University of South Carolina (Charleston), University of Utah School of Medicine (Salt Lake City), Medical College of Wisconsin (Milwaukee), US Department of Veterans Affairs (Washington, DC), and Health Management Associates (Washington, DC).

The previously documented higher TBI [mortality](#) among Hispanic veterans appears to be linked to living in the U.S. territories. The researchers of this study raised concerns about potential differences in healthcare quality between the U.S. mainland and U.S. territories.

"Too often, veterans are clustered as one large group. Although there are a number of issues that are cross cutting and important to all veterans, it is equally important to recognize the health experiences and, in this case, adverse outcomes that might exist for subgroups. In addition to awareness, this work highlights the need for innovation and outreach to achieve improved [health](#) in a group for whom we have a covenant of care because of their bravery and service." says *Health Equity* Editor-in-Chief Ana E. Núñez, MD, Associate Dean of Diversity, Equity & Inclusion and Professor of Medicine, Drexel University School of Medicine, Philadelphia, PA.
