

Residual inflammation risk affects outcomes after percutaneous coronary intervention

November 19 2018

*Adjusted for age, gender, body mass index, acute coronary syndrome, diabetes mellitus, hypertension, chronic kidney disease, previous coronary artery bypass graft and baseline LDL-C. Red HR indicates a p-value <0.01. MI: Myocardial infarction. MACE defined as death, MI and cerebrovascular accident. MACE+ defined as MACE with any revascularization.

Take home figure: Concept of residual inflammatory risk and the main findings of this study. High high sensitive C-reactive protein is defined as >2 mg/L. aAdjusted for age, gender, body mass index, acute coronary syndrome, diabetes mellitus, hypertension, chronic kidney disease, previous coronary artery bypass graft, and baseline low-density lipoprotein cholesterol. Red hazard ratio indicates a P-value
