

US health care spending highest among developed countries

January 7 2019

The United States, on a per capita basis, spends much more on health care than other developed countries; the chief reason is not greater health care utilization, but higher prices, according to a study from a team led

by a Johns Hopkins Bloomberg School of Public Health researcher.

The paper will appear in the January issue of *Health Affairs*.

The researchers determined that the higher overall [health care](#) spending in the U.S. was due mainly to higher prices—including higher drug prices, higher salaries for doctors and nurses, higher hospital administration costs and higher prices for many medical services.

The paper finds that the U.S. remains an outlier in terms of per capita [health](#) care spending, which was \$9,892 in 2016. That amount was about 25 percent higher than second-place Switzerland's \$7,919. It was also 108 percent higher than Canada's \$4,753, and 145 percent higher than the Organization for Economic Cooperation and Development (OECD) median of \$4,033. And it was more than double the \$4,559 the U.S. spent per capita on health care in 2000—the year whose data the researchers analyzed for a 2003 study.

The researchers, along with the late Princeton health care economist Uwe Reinhardt, who died in 2017, came to the same conclusion in their well-known 2003 study, "It's the prices, stupid: why the United States is so different from other countries." The new analysis is in part a tribute to the late Reinhardt.

"In spite of all the efforts in the U.S. to control health spending over the past 25 years, the story remains the same—the U.S. remains the most expensive because of the prices the U.S. pays for health services," says lead author Gerard F. Anderson, Ph.D., a professor in the Bloomberg School's Department of Health Policy and Management.

Both studies were based on an analysis of health care use and spending in the U.S. and the other industrialized countries that are members of the OECD. The updated study was co-authored by Peter Hussey, Ph.D., vice

president of the RAND Corporation and Dean Varduhi Petrosyan, Ph.D., of the American University of Armenia.

Anderson and his colleagues noticed one big difference between 2003 and 2016: a widening of the gap between what public insurers and private insurers pay for the same health care services. In order to lower per capita health care spending, the authors recommend that the U.S. should focus on what private insurers and self-insured corporations pay, since they pay significantly more than public insurers.

The researchers also found that health spending in the U.S. has been growing faster than the other OECD countries in spite of efforts to control spending in the U.S. Overall U.S. health spending increased at an average rate of 2.8 percent annually between 2000 and 2016, which is greater than the OECD median annual increase of 2.6 percent. Per capita, inflation-adjusted spending on pharmaceuticals also increased much more quickly in the U.S.—at a rate of 3.8 percent per year, compared to just 1.1 percent for the OECD median.

During the same period, U.S. gross domestic product (GDP) per capita increased by only 0.9 percent annually, which means that health care continues to represent a larger share of GDP. U.S. health care [spending](#) in 2016 totaled 17.2 percent of GDP, compared to just 8.9 percent for the OECD median.

Not only does the U.S. outspend other OECD countries, on the whole it has less access to many health care resources. The researchers found that in 2015, the most recent year for which data were available in the U.S., there were only 7.9 practicing nurses and 2.6 practicing physicians per 1,000 population, compared to the OECD medians of 9.9 nurses and 3.2 physicians.

Similarly, the U.S. in 2015 had only 7.5 new medical school graduates

per 100,000 population, compared to the OECD median of 12.1, and just 2.5 acute care hospital beds per 1,000 population compared to the OECD median of 3.4.

Although the U.S. ranked second in the numbers of MRI machines per capita and third in the numbers of CT scanners per capita—implying a relatively high use of these expensive resources—Japan ranked first in both categories, yet was among the lowest overall health care spenders in the OECD in 2016.

"It's not that we're getting more; it's that we're paying much more," Anderson says.

"It's Still The Prices, Stupid: Why The US Spends So Much On Health Care, And A Tribute To Uwe Reinhardt," was written by Gerard Anderson, Peter Hussey and Varduhi Petrosyan.
